

Logic Trees for the Cascadia Subduction Zone Used In the 2014 Update of the U.S. National Seismic Hazard Maps + M9 Slip Models

Art Frankel, USGS

Mark Petersen, USGS

Rui Chen, CGS

NTHMP-USGS workshop

Feb. 1, 2016

This information is preliminary, is subject to revision, and it is not for citation or further distribution.

This material solely provides a record of the slides shown during the USGS-NTHMP Workshop held on February 1-2, 2016 and is not a final scientific record complete with references to prior work.

The information is provided on the condition that neither the U.S. Geological Survey nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the information.

We convened three workshops of experts on the Cascadia Subduction Zone in 2010, 2011, 2012

- **Recurrence relations for M8-9 earthquakes**

Workshop to evaluate turbidite evidence for great earthquakes: Nov 18-19, 2010, Corvallis (hosted by Chris Goldfinger).

Summarized in USGS Open File Report 2011-1310. Brian Atwater wrote alternative to Goldfinger view (USGS OFR 2012-1043) and in Atwater et al. (2014) *Geology* paper.

- **Location of down-dip edge of rupture zone**

Workshop: Dec 15, 2011, Eugene (co-convened with Ray Weldon)

- Pacific Northwest workshop for NSHM, March 21-22, 2012. Spent much of first day discussing and debating results of the earlier workshops and the consensus logic tree

Interpretation of rupture history of M8-9 earthquakes from 10,000 year record of turbidites (submarine deposits of turbulent flows of sand, silt, mud, and water)

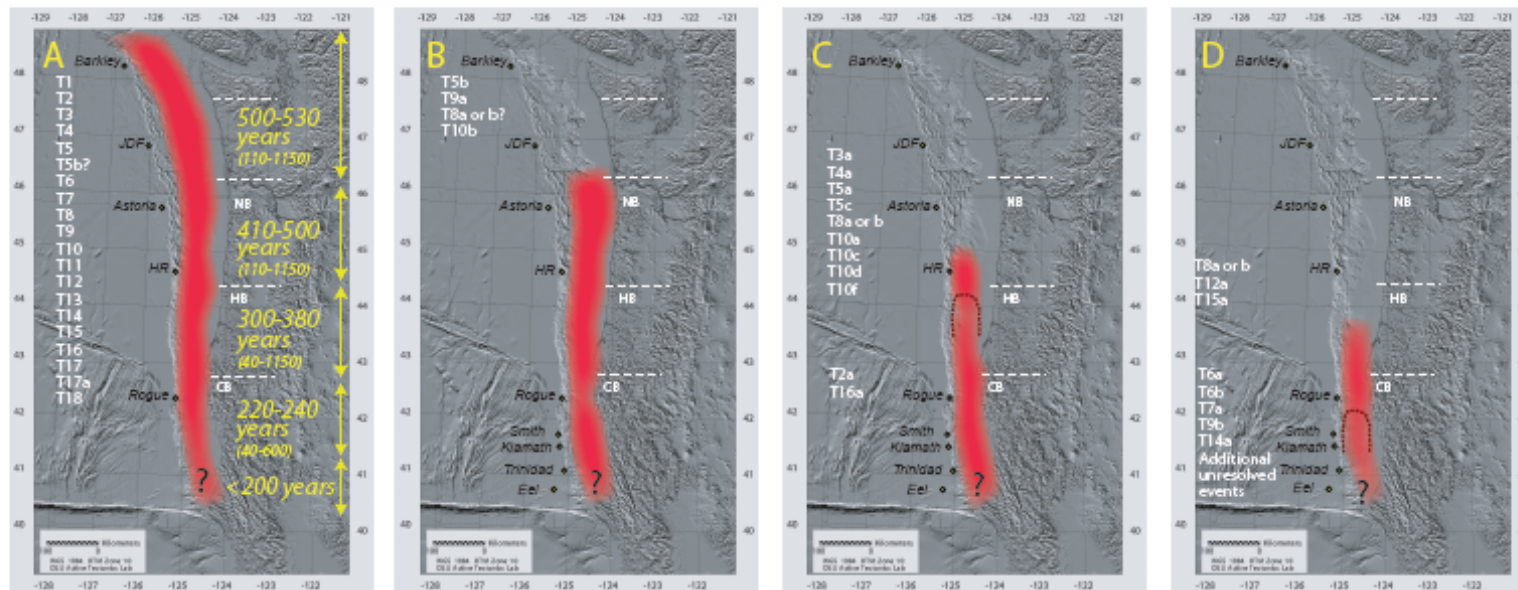

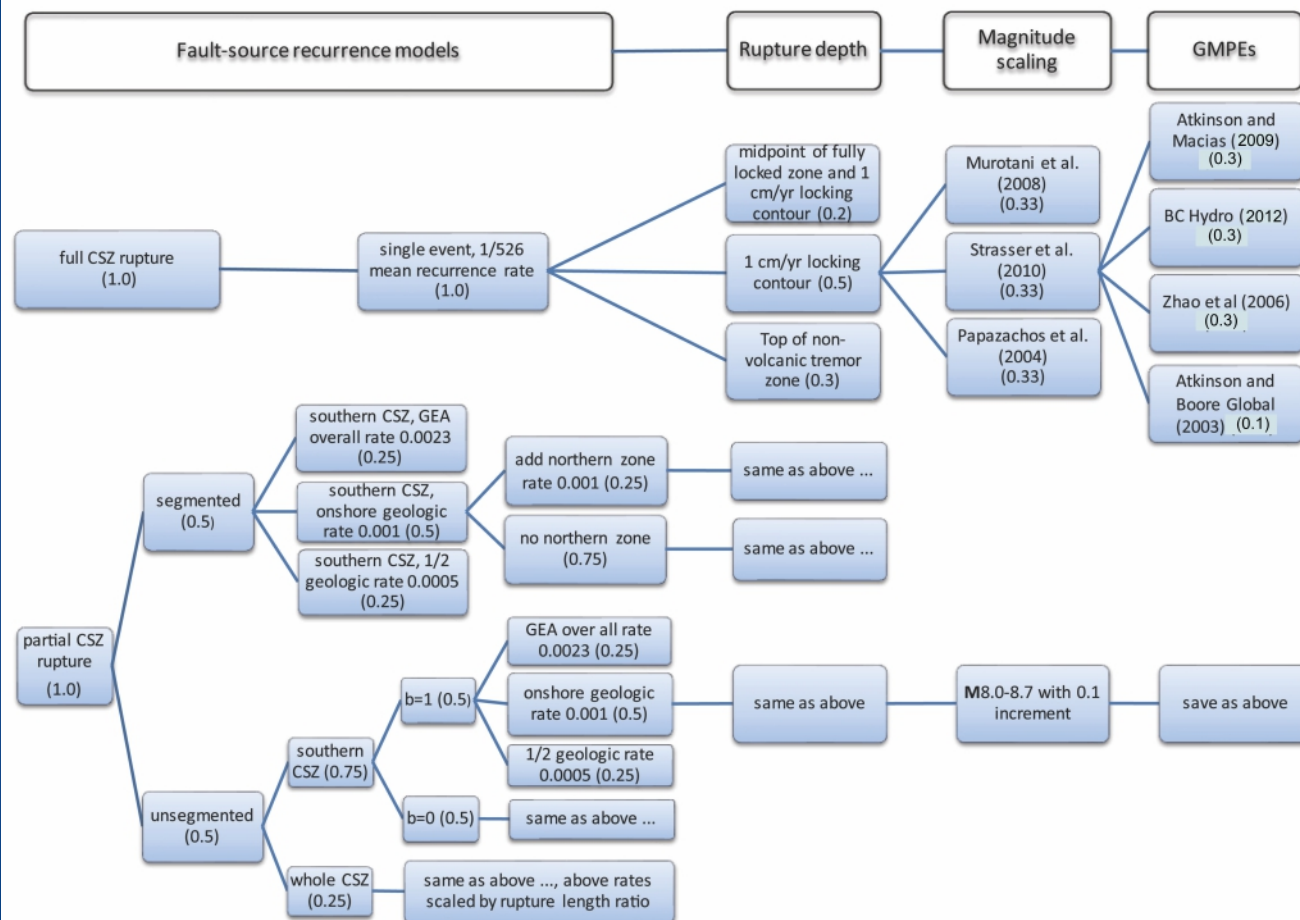

Figure from Goldfinger et al. (USGS Professional Paper 1661-F, 2012);

This information is preliminary, is subject to revision, and it is not for citation or further distribution. This material solely provides a record of the slides shown during the USGS-NTHMP Workshop held on February 1-2, 2016 and is not a final scientific record complete with references to prior work. The information is provided on the condition that neither the U.S. Geological Survey nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the information.

CSZ Logic Trees Used for 2014 U.S. National Seismic Hazard Maps

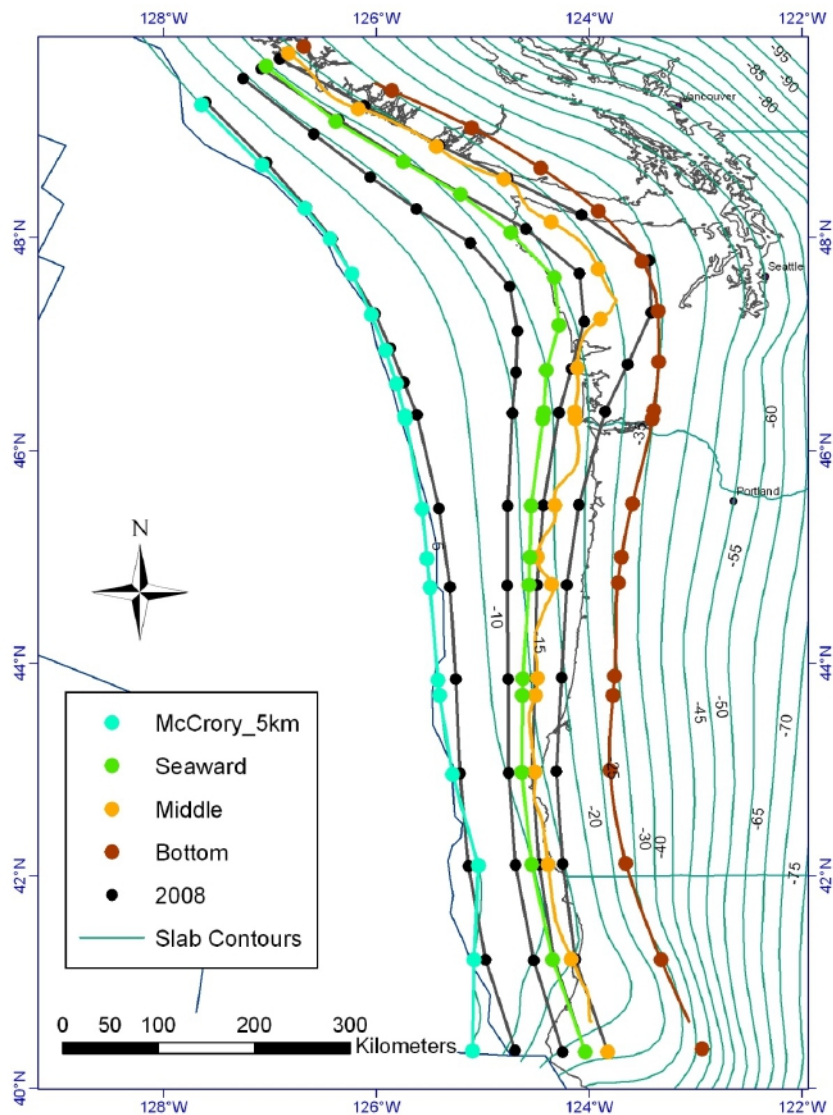

Slide from Rui Chen, CGS

This information is preliminary, is subject to revision, and it is not for citation or further distribution.

This material solely provides a record of the slides shown during the USGS-NTHMP Workshop held on February 1-2, 2016 and is not a final scientific record complete with references to prior work.

The information is provided on the condition that neither the U.S. Geological Survey nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the information.

Models for eastern, down-dip edge of CSZ M8-9 rupture zones

Red: top of tremor zone (0.3 wt)

Orange: 25% coupling (1 cm/yr) from inversion of GPS data (0.5 wt)

Green: midpoint of locked zone from thermal modeling and 25% coupling From GPS (0.2 wt)

Black lines are previous models from thermal modeling

The M9 Project: University of Washington funded
for 4 years by NSF

USGS is producing broadband (0-10 Hz) synthetic seismograms for M9
Cascadia earthquakes; considering a range of rupture scenarios

**Probabilistic Assessment
of Hazard, including
uncertainties**

Synthetic seismograms
produced from 3D simulations
of M9 Cascadia earthquakes
(Frankel, Wirth)

Tsunami simulations for M9
Cascadia earthquakes
(Gonzalez, LeVeque)

Supercomputer time provided
by Pacific Northwest National
Laboratory

Probabilistic Assessment of Impact

Evaluation of tall building response and
damage from long-duration, long-period ground
shaking (Berman, Eberhard, Marafi)

Evaluation of landslides and liquefaction
from ground shaking (Duvall, Wartman, Kramer,
Greenfield, Grant)

Evaluation of tsunami effects on structures
near coast (Motley, LeVeque, Gonzalez)

Development of Shakemaps and tsunami-
Inundation maps for emergency management,
improving community resilience (Bostrum, Abramson)

Testing of Earthquake Early Warning (Vidale, Bodin)

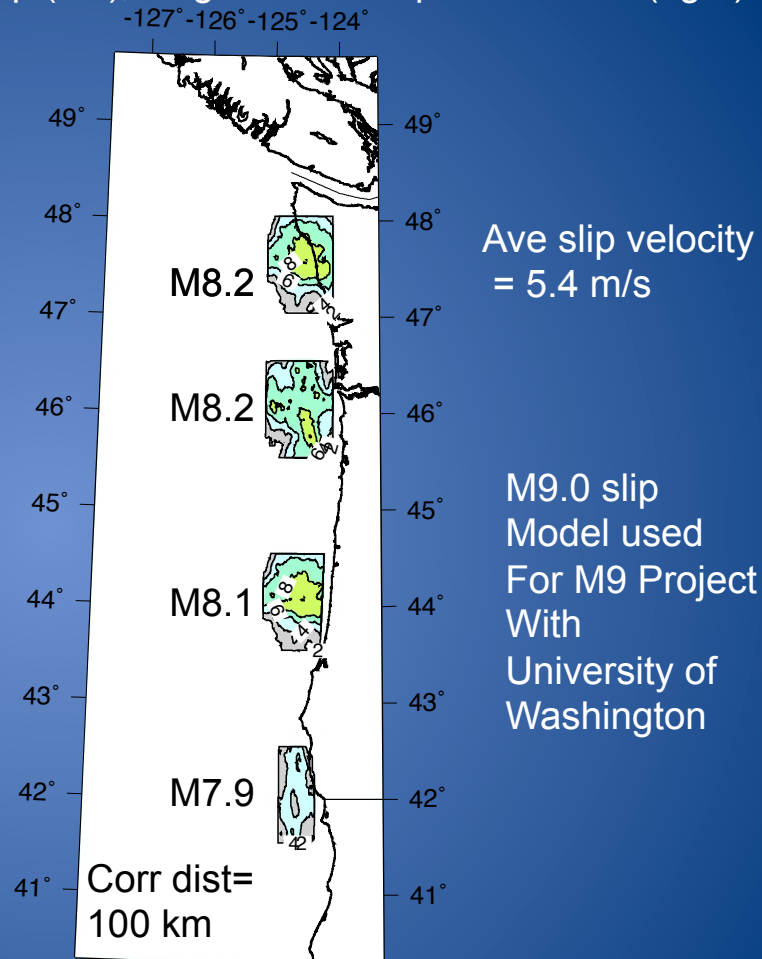

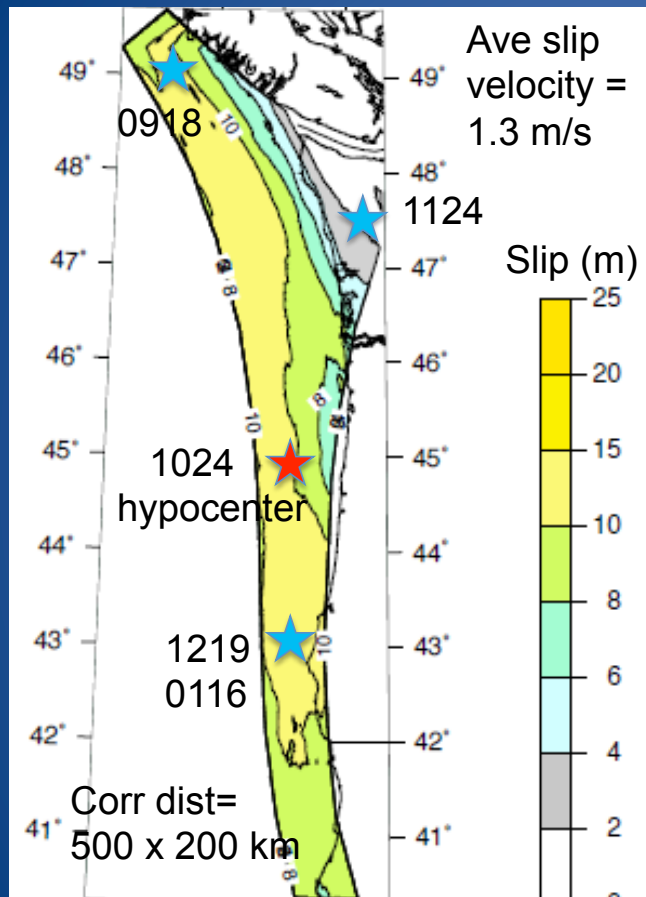

This information is preliminary, is subject to revision, and it is not for citation or further distribution.

This material solely provides a record of the slides shown during the USGS-NTHMP Workshop held on February 1-2, 2016 and is not a final scientific record complete with references to prior work.

The information is provided on the condition that neither the U.S. Geological Survey nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the information.

Compound rupture model: background slip (left); high stress drop sub-events (right)

Background slip with slow buildup

These sources are additive; sub-events similar to those used to model M8.8 Maule strong-motion records

This information is preliminary, is subject to revision, and it is not for citation or further distribution.

This material solely provides a record of the slides shown during the USGS-NTHMP Workshop held on February 1-2, 2016 and is not a final scientific record complete with references to prior work.

The information is provided on the condition that neither the U.S. Geological Survey nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the information.

Some Future Studies Needed To Better Determine Recurrence Times and Source Zones for M8-9 CSZ earthquakes

- Additional coring of marine sediments to better understand origin of mud turbidites and their spatial-temporal correlations; also need better understanding of turbidite records in northern CSZ; investigate possibility of triggering of turbidites by M7 Gorda plate earthquakes or crustal earthquakes
- Additional onshore paleoseismology and paleogeodesy to better determine history of M8-9 CSZ earthquakes
- Investigate possibility of M9 Tohoku type rupture with very large slip and shorter rupture zone

This information is preliminary, is subject to revision, and it is not for citation or further distribution.

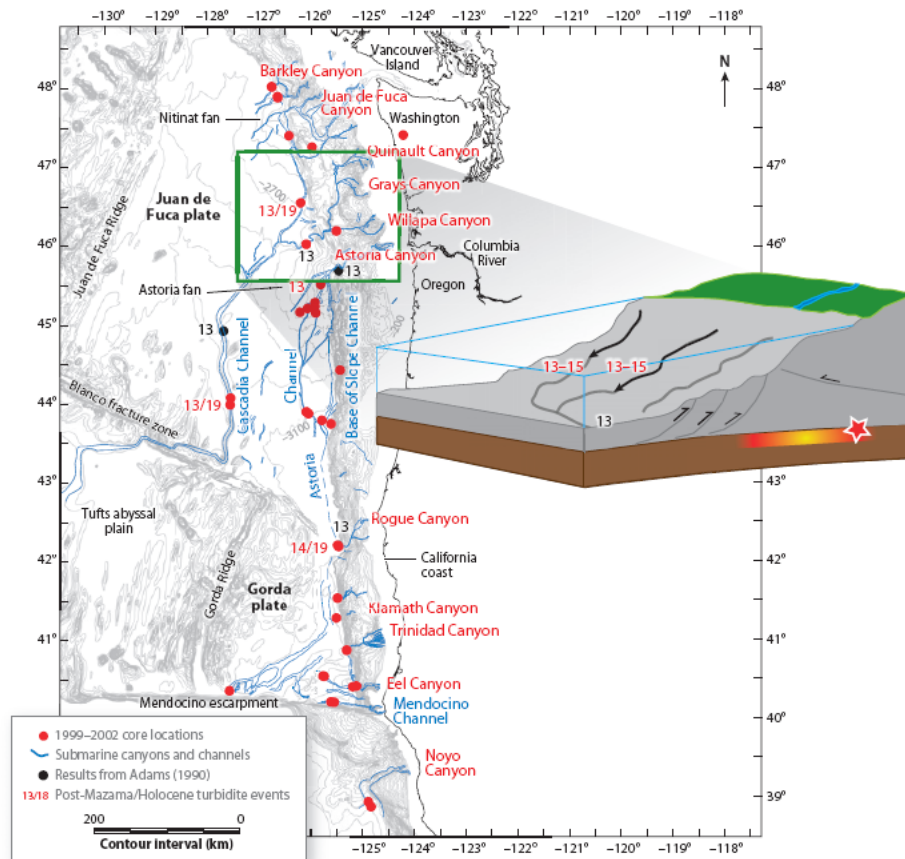

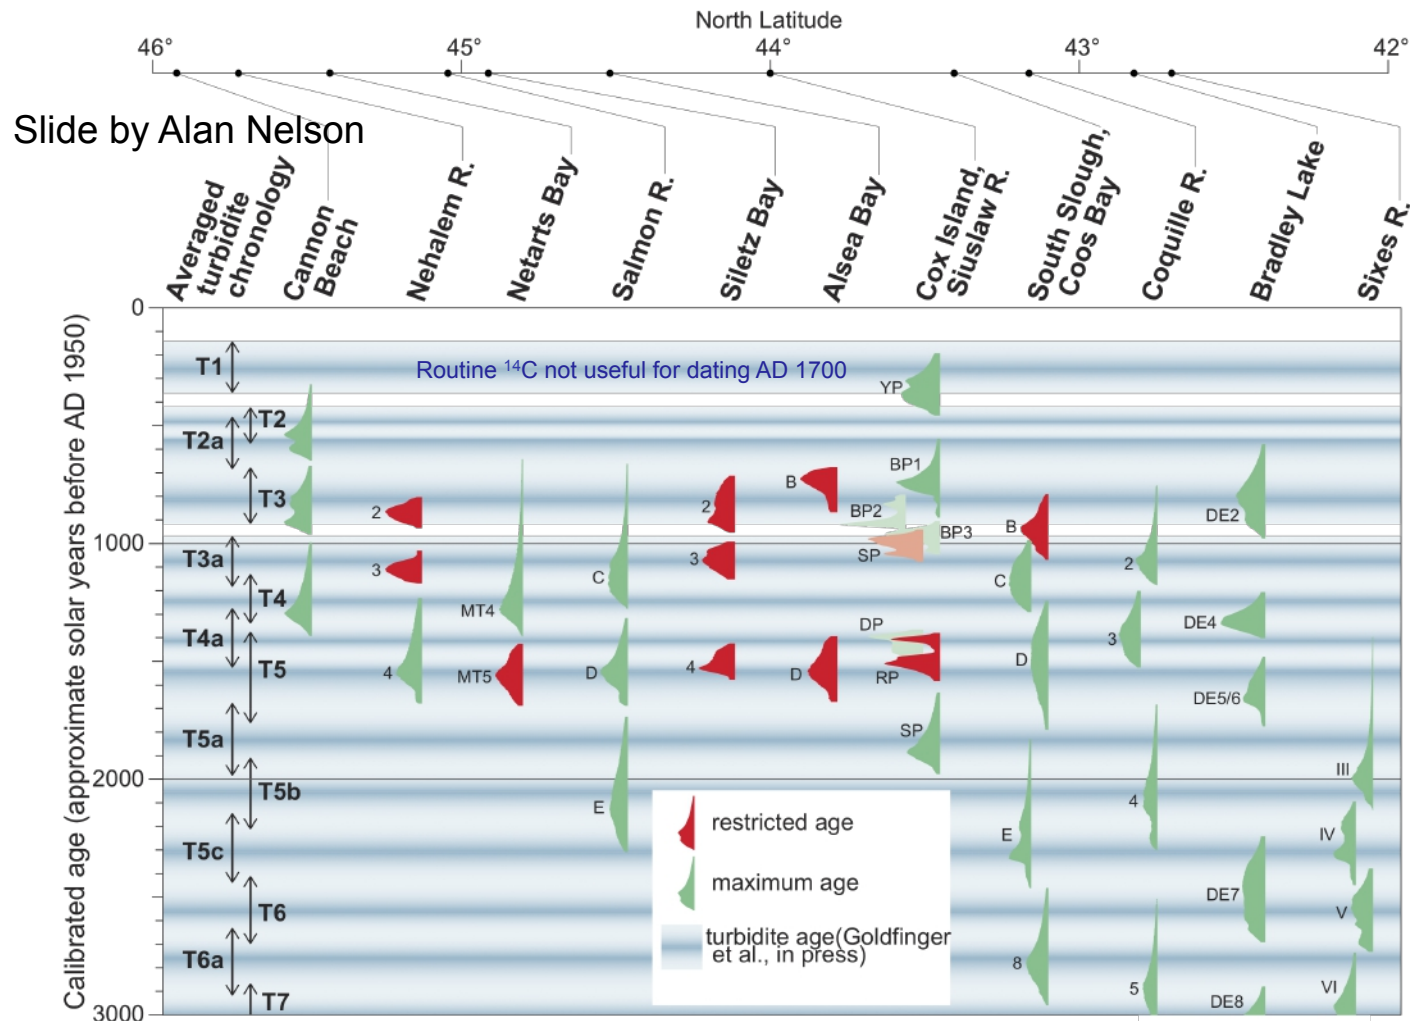

Figure 6

Synchronicity test at a channel confluence as applied where multiple Washington channels merge into the Cascadia Deep Sea Channel (green square). The number of events downstream should be the sum of events in the tributaries, unless the turbidity currents were triggered simultaneously. The remarkable similarity of records in northern Cascadia supports the initial conclusion of Adams (1990) that these events are likely of earthquake origin. The number of events present above the Mazama ash remains constant between tributaries and the main stem. The internal structure and number of coarse pulses also remain constant after passage through the confluence.

Compilation of on land paleoseismic data

From Nelson et al. (2006)

This information is preliminary, is subject to revision, and it is not for citation or further distribution. This material solely provides a record of the slides shown during the USGS-NTHMP Workshop held on February 1-2, 2016 and is not a final scientific record complete with references to prior work. The information is provided on the condition that neither the U.S. Geological Survey nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the information.

- Included hazard from great Cascadia earthquakes since 1996 NSHM's.
- Used recurrence rate derived from on-shore paleoseismology (e.g., Atwater and Hemphill-Haley)
- Allowed for whole CSZ rupture M9 and partial rupture M8's.

This information is preliminary, is subject to revision, and it is not for citation or further distribution.
